

PEXATHERM

underfloor heating manifold

PEXATHERM manifolds are made of quality brass components. The top manifold is the return section and consists of 1.25" brass tube and non-return valves with plastic handwheels. The PEXATHERM distribution manifold must be assembled before fixing to the wall or in the optional manifold cabinet.

1- The 1" isolating ball can be fitted to either side of the manifolds. The temperature gauge sleeve/adaptor is fitted to the return (top) manifold. Although PTFE tape can be used, we provide pipe sealant compound which seals without having to overtighten the joint.

2- The end cap assemblies, the air vents, the plug and the drain are screwed in place, using above paste while making sure they are upright when tightened. Check that all the components are in position and tightly screwed in position.
